4.2	Package/Dependency managers	9
4.3	Applications	10
5	License	13
5.1	Product license	13
5.2	FOSSA scan overview	13
5.3	FOSSA Live Project report	13

Quickly build custom Docker images for local development without having to write Dockerfiles.

```
# Build an image with vim and curl using apt-get
docker run -it --rm $(dugaire build --apt=vim,curl)

# Build an image with wget, and nano using apt-get and install latest azure-cli version ↴
# using pip3.
docker run -it --rm $(dugaire build --apt=wget,nano --pip3=azure-cli)

# Build an image with latest kubectl version
docker run -it --rm $(dugaire build --with-kubectl=latest)

# Build an image with kubectl 1.15.0
docker run -it --rm $(dugaire build --with-kubectl=1.15.0)
```

CHAPTER
ONE

INSTALL (ON LINUX)

1.1 Using pip (recommended)

```
pip install dugaire
```

1.2 From source

Clone this repository.

```
git clone https://github.com/tadeugr/dugaire.git
```

cd to its directory.

```
cd dugaire
```

Install it (requires pip).

```
make install
```

You should have the command available.

```
dugaire build --help
```

CHAPTER TWO

USAGE

```
Usage: dugaire [OPTIONS] COMMAND [ARGS]...

CLI tool to build and manage custom Docker images.

Options:
--version Show the version and exit.
--help    Show this message and exit.

Commands:
build   Build Docker images with custom packages.
list    List images built with dugaire.
rmi    Remove images built with dugaire.
version Show the version and exit.
```

2.1 dugaire build

```
Usage: dugaire build [OPTIONS]

Build Docker images with custom packages.

Examples:

Build an image and install vim and curl using apt-get.

$ dugaire build --apt=vim,curl

Build an image and install python3 using apt-get and ansible using pip3.

$ dugaire build --apt=python3-pip --pip3=ansible

Build an image and install the latest version of kubectl.

$ dugaire build --with-kubectl=latest

Options:
--from <name:tag>           Base image (used in Dockerfile FROM).
                            Example: --from=ubuntu:20.04 [default:
                                          ubuntu:20.04; required]
```

(continues on next page)

(continued from previous page)

--name <name:tag>	Image name. Example: --name="myimage:0.0.1" [default: random]
--apt <pkg01 pkg01,pkg02>	Comma separated list of packages (no blank space) to install using apt-get install. Requires a base image with apt-get. Example: -apt=curl,vim
--pip3 <pkg01 pkg01,pkg02>	Comma separated list of packages (no blank space) to install using pip3 install. WARNING: requires -apt=python3-pip. Example: -apt=python3-pip -pip3=ansible,jinja2
--with-kubectl <latest semantic versioning>	Install kubectl. Examples: --with-kubectl=latest / --with-kubectl=1.17.0
--with-terraform <latest semantic versioning>	Install terraform. Examples: --with-terraform=latest / --with-terraform=0.15.5
--with-velero <latest semantic versioning>	Install velero. Examples: --with-velero=latest / --with-velero=1.5.2
--force	Ignore Docker cache and build from scratch.
--dry-run	Do not build image.
-o, --output [image.id image.id.short image.name dockerfile]	Command output options. [default: image.id.short]
--help	Show this message and exit.

CHAPTER
THREE

ENABLE AUTOCOMPLETE

To enable autocomplete for your current terminal session, run:

```
eval "$(_DUGAIRE_COMPLETE=source dugaire)"
```

Follow the instructions below to permanently enable autocomplete.

3.1 bash

```
echo 'eval "$(_DUGAIRE_COMPLETE=source dugaire)"' >> ~/.bashrc
```

3.2 zsh

```
echo 'eval "$(_DUGAIRE_COMPLETE=source dugaire)"' >> ~/.zshrc
```

SUPPORTED FEATURES

4.1 Base images

Tested with:

- ubuntu:20.04

You may use base images that were built from the tested images.

4.2 Package/Dependency managers

4.2.1 apt-get

You can install any package using apt

Use a comma separated list (no blank space) of packages you want to install.

Example:

```
dugaire build --apt wget,iutils-ping
```

4.2.2 pip3

You can install any package using pip3

Use a comma separated list (no blank space) of packages you want to install.

Use <package name>==<version> to install specific versions.

Example:

```
dugaire build --pip3 jinja2,azure-cli==2.39.0
```

4.3 Applications

4.3.1 kubectl

Options

--with-kubectl=latest to install the latest version.

--with-kubectl=1.17.0 (*example*) to install specific versions.

See all versions available [here](#).

Covered by automated tests

You may install any version available. The commands bellow only describes versions included in the automated tests.

```
dugaire build --from=ubuntu:20.04 --with-kubectl=latest
dugaire build --from=ubuntu:20.04 --with-kubectl=1.18.0
dugaire build --from=ubuntu:20.04 --with-kubectl=1.17.0
dugaire build --from=ubuntu:18.04 --with-kubectl=1.16.0
dugaire build --from=ubuntu:18.04 --with-kubectl=1.15.0
```

4.3.2 terraform

Options

--with-terraform=latest to install the latest version.

--with-terraform=0.15.05 (*example*) to install specific versions.

See all versions available [here](#).

Covered by automated tests

You may install any version available. The commands bellow only describes versions included in the automated tests.

```
dugaire build --from=ubuntu:20.04 --with-terraform=latest
dugaire build --from=ubuntu:20.04 --with-terraform=0.15.05
```

4.3.3 velero

Options

--with-velero=latest to install the latest version.

--with-velero=1.5.2 (*example*) to install specific versions.

See all versions available [here](#).

Covered by automated tests

You may install any version available. The commands bellow only describes versions included in the automated tests.

```
dugaire build --from=ubuntu:20.04 --with-kubectl=latest --with-velero=latest
dugaire build --from=ubuntu:20.04 --with-kubectl=1.17.0 --with-velero=1.5.2
```
